DIKRI ALI

Software Engineering · Fullstack Developer · AI & Computer Vision Enthusiast

+6282111784160 | dikri.ali_ti23@nusaputra.ac.id | linkedin.com/in/dikri-ali | github.com/Dkrii | portofolio.dikri.workers.dev

Sukabumi, Indonesia

Seventh-semester Informatics Engineering (Software Engineering) student at Universitas Nusa Putra with fullstack development experience from an internship in the IT Department at PT Akebono Brake Astra Indonesia. Builds independent projects in AI/ML, computer vision (YOLO), and RAG systems (FastAPI) to deepen practical engineering skills.

WORK EXPERIENCES

PT Akebono Brake Astra Indonesia — Jakarta, Indonesia

Fullstack Developer Intern

- Architected and built a fullstack Dies Management System, digitizing dies-movement tracking across production lines for Astra Otoparts and replacing a manual, paper-based process.
- Trained YOLO-based object detection/segmentation models in Google Colab and annotated production datasets in Roboflow, advancing the facility's automated visual inspection capabilities.
- Built a detailed 3D digital twin of the PT Akebono Brake Astra Indonesia facility and its interior assets in Blender for interactive facility orientation and planning.

PROJECTS

ChatbotSunda — RAG-Based Sundanese Language & Culture Chatbot

Personal Project · FastAPI · Vue 3 · ChromaDB · Redis · Docker

- Designed and built a full-stack Retrieval-Augmented Generation (RAG) chatbot end-to-end: a Vue 3 frontend, a FastAPI backend with streaming (SSE) responses, and an internal ops dashboard for monitoring, ingestion, and retrieval debugging.
- Engineered a hybrid retrieval pipeline combining semantic search (ChromaDB with multilingual embeddings) and BM25 keyword search, with reranking and diversity filtering (MMR) to improve grounded-answer relevance.
- Built a document ingestion pipeline with hash-based deduplication, automatic content categorization, and chunking, plus Redis-backed semantic caching, rate limiting, and session history for production-style reliability.

Interactive 3D Portfolio — BMS/HUD-Style Personal Website

Personal Project · Blender · Blender MCP · Hyper3D Rodin · Live: portofolio.dikri.workers.dev

- Designing and developing an interactive 3D personal portfolio website centered on a custom Blender-modeled house, styled with a Building Management System (BMS)/HUD-inspired aesthetic and animated camera flight paths triggered by navigation.
- Integrating an AI-assisted 3D pipeline (Blender MCP + Hyper3D Rodin) to accelerate building and iterating on 3D scene assets for the site.

EDUCATION LEVEL

Universitas Nusa Putra — Sukabumi, Indonesia

Bachelor of Informatics Engineering, GPA 3.68/4.00

SKILLS

Programming Languages: PHP, Python, JavaScript

Frameworks & Libraries: Laravel, FastAPI, React, Vue.js

Databases: PostgreSQL, MySQL, ChromaDB, Redis

AI & Computer Vision: YOLO, OpenCV, OCR, Roboflow

Development & Tools: REST API, Git, Docker

3D: Blender, Blender MCP
